DISASTER RECOVERY WITH SPSA

Executive Summary

Skillplan Secure Access offers a powerful and secure **solution for disaster recovery after cyberattacks**. The possibility of **installation without Internet access, the protection of "red" zones and the fast commissioning** make SPSA an essential component for resilient IT environments.

Challenge:

Cyberattacks such as ransomware, data manipulation and unauthorized access can paralyze companies within minutes.
In critical situations, every second counts - a fast, secure recovery is essential to minimize business interruptions.
However, conventional recovery processes are often too slow, too complex and rely on internet connections that are not always available in an emergency.

Solution:

Skillplan Secure Access (SPSA) provides an isolated, highly secure environment for fast and secure system access - even without an internet connection. Specially developed for the protection of sensitive ("red") zones, enables reliable recovery, even under extreme conditions.

Commissioning

Immediate provision through preconfigured appliance or VM. Possible without internet access.

Secured access

Protected recovery environment for compromised IT systems.
Access control with zero-trust principles to prevent re-infection.

Measurable results

Restoration of affected systems in the shortest possible time. Protection against renewed attacks through secure access mechanisms.

Cost savings

Reduction of financial damage through rapid response.

Risk minimization

Fast recovery of critical systems through secure backup access. Prevention of propagation effects through isolated recovery processes.
