REMOTE MAINTENANCE WITH SPSA

Executive Summary

Skillplan Secure Access (SPSA) offers a secure and user-friendly solution for remote maintenance

With time-controlled maintenance windows, full logging, and MFA-protected accounts, the highest level of security and control is ensured – without a VPN client.

Challenge:
Companies are increasingly relying on remote maintenance to efficiently maintain and update systems. At the same time, unsecured remote access poses a significant security risk. VPN solutions are often cumbersome, difficult to manage, and lack granular control over external access.

Solution:
Skillplan Secure Access (SPSA) enables secure, logged, and controlled remote maintenance without the need for a VPN client.
With time-controlled maintenance windows, MFA-protected accounts and a central access point, maximum security is guaranteed with minimal administrative effort.
Recording of accesses
- Detailed logging of all maintenance sessions for complete traceability.
- Protection against misuse and unauthorized changes.

MFA
- Multi-factor authentication for all administrative remote access.
- Protection against unauthorized access and account takeovers.
Measurable results
- Secure, traceable remote access to IT and OT systems.
- Reduction of misconfigurations and uncontrolled access attempts.

Single point of control
- Central control of all remote access via a secure platform.
- Reduction of the attack surface through a uniform access concept.

No VPN client required
Direct, secure access without complex VPN infrastructures.
